The algorithm for constructing a reflexive transitive ~~closure~~ closure, firstly is to add reflexive pairs $(a, a) \dots$ for every $a \in A$ (A is the ~~set~~ tuple in program). Then enumerate all ~~length-i~~ length- i sequence $(b_1, b_2, \dots, b_i)$ for $i = 2 \dots |A|$. If every adjacent pair $(b_j, b_{j+1}) \in R$, insert its endpoint pair ~~(b_1, b_i)~~ (b_1, b_i) into R^* .
